The Top Ten Reasons Why 3D Works Exceptionally Well On Sand-Based Substrates and Sandy Soils

1. **ENABLE PLANTS TO RETAIN MOISTURE, THUS THE PLANT WILL BE SLOWER TO WILT.**
2. **SUPPLY HORMONES TO PLANTS THAT WILL ENHANCE ROOT DEVELOPMENT, THUS PROVIDING A LARGER RESERVOIR FOR THE PLANTS TO OBTAIN MOISTURE.**
3. **PROVIDE A CHELATION TO ENSURE IRON (AND OTHER NUTRIENTS) UP-TAKE BY THE PLANTS.**
4. **PROVIDE A TOLERANCE TO CERTAIN DISEASES.**
5. **PROVIDE BETTER COLOR.**
6. **ENHANCE THE PLANT'S TOLERANCE TO PESTICIDE INJURY.**
7. **SPEED JUVENILE PLANT DEVELOPMENT, THUS PROVIDING MORE RAPID GROUND COVER AND MODERATION OF SOIL TEMPERATURES.**
8. **ENHANCE ROOT DEVELOPMENT, THUS INCREASING ORGANIC MATTER IN THE ROOT ZONE, THEREFORE PROVIDING STABILIZATION OF THE SOIL (LESS EROSION).**
9. **ENHANCE THE DEVELOPMENT OF INSECT RESISTANCE IN PLANTS.**

EXTRA!!

- If your biostimulant is not doing all of this for you, you are paying too much and wasting your time.**
- If you used a biostimulant in the past, and were disappointed with the results, it was not 3D.**

If you haven't used a biostimulant, the time has come.

At PlantWise, we make no unsubstantiated claims. You may write us for complete documentation of the listed statements.
